

What is claimed is:

1. A CRC calculation method for a message,
comprising the steps of:

5 defining a generator matrix having a maximum value of
 the non-zero entries for representing an LFSR
 corresponding to a form for linearly mapping an
 input vector to a remainder vector;

 transforming the generator matrix to a similar matrix
10 for reducing the maximum value of the non-zero
 entries;

 arranging the message inputted in the form to the input
 vector; and

 transforming the message to a CRC result by
15 multiplying the similar matrix to the input vector.

2. A method according to claim 1, wherein the form is
a byte-wise form.

20 3. A method according to claim 1, wherein the form is
a doubleword-wise form.

 4. A method according to claim 3, wherein the step of
arranging the message to the input vector comprises padding the
25 message with one or more dummies.

5. A method according to claim 3, further comprising initiating the LFSR with a specific value.

5 6. A method according to claim 5, further comprising identify a length type of the message and determining the specific value in accordance with the length type.

7. A method according to claim 3, further comprising
10 comparing the CRC result with a specific pattern.

8. A method according to claim 7, further comprising identify a length type of the message and determining the specific pattern in accordance with the length type.

15 9. A method according to claim 1, wherein the step of transforming the message to a CRC result comprises performing an iteration procedure between the remainder vector and the input vector.

20 10. A method according to claim 1, wherein the step of transforming the generator matrix to a similar matrix comprises the steps of:

selecting an invertible matrix;
25 generating an inverse matrix of the invertible matrix;

and
multiplying the invertible matrix, generator matrix and
inverse matrix.

5 11. A method according to claim 10, further
comprising inserting a flip-flop procedure between the multiplying
of the invertible matrix and generator matrix for forming a pipeline
architecture.

10 12. A CRC calculation system for generating a CRC
result from a message, comprising:

means for arranging the message inputted in a form to
an input vector;

15 a generator matrix having a maximum value of the
non-zero entries for representing an LFSR
corresponding to the form for linearly mapping the
input vector to a remainder vector; and

20 means for transforming the generator matrix to a
similar matrix for reducing the maximum value of
the non-zero entries; and

means for multiplying the similar matrix to the input
vector.

25 13. A system according to claim 12, wherein the form
is a byte-wise form.

14. A system according to claim 12, wherein the form is a doubleword-wise form.

5 15. A system according to claim 14, further comprising one or more dummies for padding the message thereto.

10 16. A system according to claim 14, further comprising a specific value for initiating the LFSR therewith.

15 17. A system according to claim 16, further comprising means for identifying a length type of the message and determining the specific value in accordance with the length type.

 18. A system according to claim 14, further comprising means for comparing the CRC result with a specific pattern.

20 19. A system according to claim 18, further comprising means for identifying a length type of the message and determining the specific pattern in accordance with the length type.

25 20. A system according to claim 12, wherein the

means for transforming the generator matrix to a similar matrix
comprises means for multiplying the generator matrix to an
invertible matrix.

5 21. A system according to claim 20, wherein the
means for transforming the generator matrix to a similar matrix
comprises means for multiplying an inverse matrix of the
invertible matrix to the generator matrix.

10 22. A system according to claim 12, further
comprising means for forming a pipeline architecture between the
message and CRC result.
